

ABSTRACT

A fastening assembly using the keyhole principle is provided. For this purpose, a first component having a bolt that has a round and smooth head is guided through the larger opening of the keyhole, in order then with the head to engage behind the smaller opening of the keyhole-like cut-out for fastening. At the end of its shank, the bolt preferably features an external tothing or an external polyhedron as engagement surface for a tool for fastening the first component to the second component.
